

STBA48026 NEXT GENERATION TEA BREWER (NGTB) WITH INTEGRATED SWEETENER PUMP

CLEANING INSTRUCTIONS

BREWER CLEANING INSTRUCTIONS

Daily Cleaning

1. Wipe any spills, dust or debris from the exterior surfaces with a damp cloth. The outside surfaces of the brewer should be cleaned with stainless steel polish only, to prevent scratches.
2. Clean the spray head and domed area around the spray head with a mild detergent and warm water solution. Scrub well to remove residue. Rinse with clear water. Dry with a clean cloth.
3. Remove and thoroughly clean and sanitize the entire plastic brew basket, the four legs and the basket orifice using a mild detergent solution and hot water. Dry it before use or put it through a dishwasher cleaning cycle, then dry before use.
4. Wash the tea container. Clean the container and the top cover with a detergent solution.

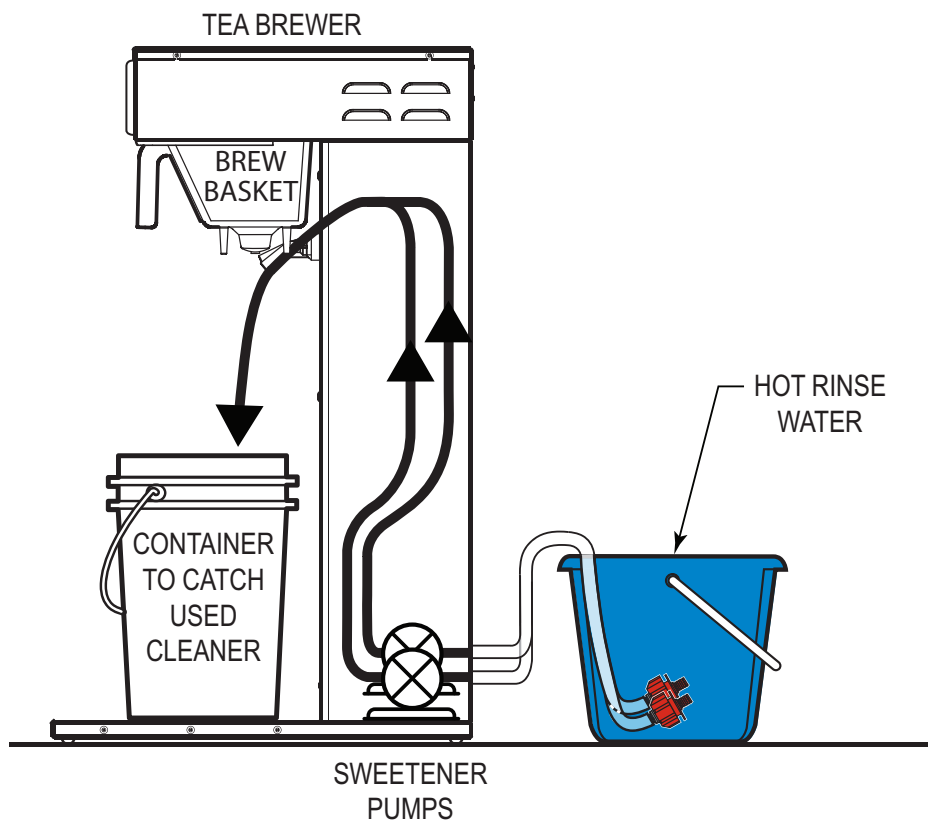

Weekly Cleaning and Sanitizing

Use a concentrated cleaning solution to simplify the cleaning procedure. This procedure requires a one gallon bucket of cleaning solution of warm water and a granulated concentrated sanitizer/cleaner, diluted as specified by the manufacturer in a one gallon bucket of clean warm water (maximum 120°F).

1. Make sure the brewer is on and the water supply is hooked up.
2. Remove both quick disconnect connectors (Scholle) from the tea sweetener bag-in-box (BIB) product bags.
3. Attach male hose fittings to both Scholle. **IMPORTANT:** The cleaning process will not work without both male hose fittings attached. See the diagram on the following page.
4. Immerse both Scholle, with male hose fittings attached in the bucket of cleaning solution.
5. Place an empty tea container on the brew deck and an empty brew basket below the spray head.
6. Press and hold the **PRIME** button to draw the cleaner through the system. Release the **PRIME** button when there is about 2 inches of cleaning solution in the bottom of the bucket under the brew basket.
7. Allow the brewer to sit for the amount of time specified by the sanitizer/cleaner manufacturer with the cleaning solution in the sweetener hoses/lines before flushing the cleaning solution.
8. Flush the system by filling a one gallon container with clean hot water (no cleaning solution). Immerse BOTH quick disconnect connectors, with male hose fittings attached, in the bucket of hot water. Press and hold the **PRIME** button to draw the hot water through hoses until all the cleaning solution has been flushed from the system.
9. Discard solution that poured into the container under the brew basket.
10. Remove the Scholle from the hot water and remove the male hose fittings.
11. Reconnect both Scholle to the BIB sweetener bags.
12. Use the **PRIME** button to prime both sweetener lines.
